Introducing Brighton's Welded Plate Solution

Manufacturing cost reductions are as easy as shopping Brighton's plate layouts. At Brighton, we have the capability to manufacture large plates on our plasma or sub arc seam welders. Plates can be welded into nearly any size imaginable and are limited only by shipping availability. The welding process is identical to that used in the manufacture of Brighton Tru-Edge Heads.

As an ASME code shop with seven seam welders and real time X-ray, our customers can be sure their job will be done on time and with the highest quality. Welded plates can be produced 3/16" through 1" and offer an economical alternative to wider plates currently being used in the manufacture of tank shells.

Brighton welded plate options allow our customers to strategically place welds and eliminate manufacturing concerns. Cutting and welding together allows Brighton to offer significant cost savings on stainless steel and nickel alloy plates. Brighton welded plates can also be supplied as rolled cylinders and shipped to customer's shop or job site.
